

## Midterm Exam #2 – MATH 457

Stephen G. Simpson

April 13, 2012

This is a 50-minute exam. While taking this exam, you may not consult any books, notes, or electronic devices.

1. Write a register machine program which computes the 1-place number-theoretic function  $F(n)$  = the  $n$ th Fibonacci number. The precise definition of  $F$  is as follows:

$$F(0) = F(1) = 1, F(n+2) = F(n) + F(n+1).$$

2. Consider the 1-place partial number-theoretic function  $\psi(n) = n/p$  where  $p$  is the largest prime divisor of  $n$ . Prove that  $\psi$  is partial computable.

Notes:

- (a) There is no need to write a register machine program.
  - (b) In your proof that  $\psi$  is partial computable, you may use known lemmas and theorems, for instance our lemmas concerning bounded quantification, the least number operator, etc.
  - (c)  $\psi(0)$  and  $\psi(1)$  are undefined.
3. Write a sentence  $A$  such that the spectrum of  $A$  is the set of powers of two. In other words, your sentence should have the property

$$\text{spec}(A) = \{2^n \mid n = 0, 1, 2, \dots\} = \{1, 2, 4, 8, 16, \dots\}.$$
